

ITClaim

Stop overpaying GST. Claim what's yours.

In India, every GST-registered freelancer and small business owner pays 18% GST on business expenses. By law, this can be reclaimed as Input Tax Credit (ITC) — but most never do. The process is complex, invoices get lost, and the government portal is impossible to navigate. The result: thousands of rupees silently overpaid every year.

The Problem

Why Freelancers Lose Thousands Every Year

What is GST Input Tax Credit?

GST (Goods & Services Tax) is charged at 18% on most business services and products in India. When you buy a laptop, pay your Airtel bill, or subscribe to AWS — you pay 18% GST on top. The law allows registered businesses to deduct this GST paid (called Input Tax Credit) from the GST they collect from their own clients. In theory, you should never double-pay GST.

Why Freelancers Don't Claim It

The reality is very different. Most freelancers (1) don't know which expenses qualify, (2) lose paper invoices or forget to download digital ones, (3) find the government GSTN portal confusing and intimidating, (4) miss the monthly filing deadline after which the ITC is permanently forfeited, and (5) can't afford a CA just to handle expense tracking.

The Financial Impact

A freelancer earning ₹10–15 LPA typically pays GST on ₹2–3 lakh of business expenses annually. That's ₹36,000–₹54,000 in GST paid — most of which is legally reclaimable. Instead, it quietly flows back to the government. Nationally, an estimated ₹1–2 lakh crore in ITC goes unclaimed every single year. This is not a niche problem. It is a systemic failure affecting crores of small business owners.

The ITC Gap — How Money Is Lost

"The government owes small businesses money. The process of collecting it is so painful that most people give up — and the government quietly keeps it."

The Solution

ITClaim — Built for India's Freelancers

ITClaim is a full-stack web application that eliminates the pain of GST Input Tax Credit recovery. It automates the three hardest parts: knowing what's claimable, collecting invoices, and tracking deadlines — so freelancers can focus on their work instead of tax paperwork.

■ Smart Expense Logging

Log any business expense. ITClaim instantly tells you if it's GST-claimable, not claimable, or needs a CA review — with a plain-English reason why.

■ Invoice Scanner (OCR)

Upload a photo of any invoice. Tesseract.js OCR reads the vendor name, amount, and GST number automatically. No manual typing required.

■ ITC Dashboard

See your total claimable ITC this month in one big number. Know exactly how much you're saving vs. how much you were overpaying before.

■ Deadline Reminders

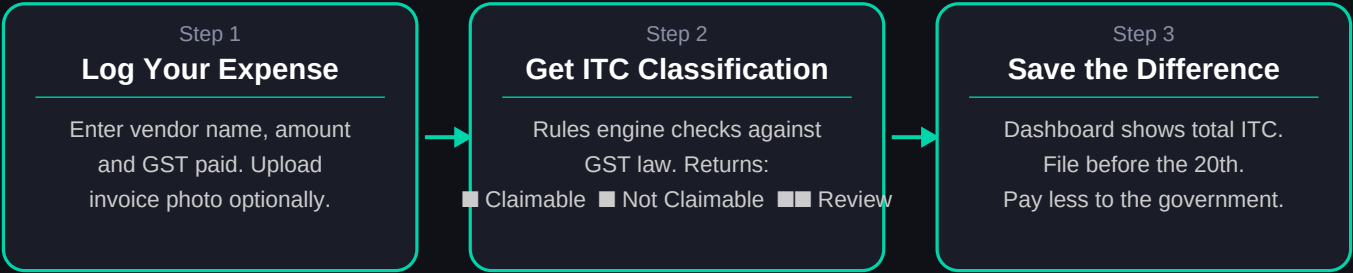

GST filing is due by the 20th of every month. Miss it and that ITC is gone forever. ITClaim shows a live countdown and alerts you in time.

■ Monthly PDF Reports

Export a clean PDF report of all your ITC for the month. Share it directly with your CA. No more digging through bank statements.

How It Works

Three Steps to Reclaim Your GST

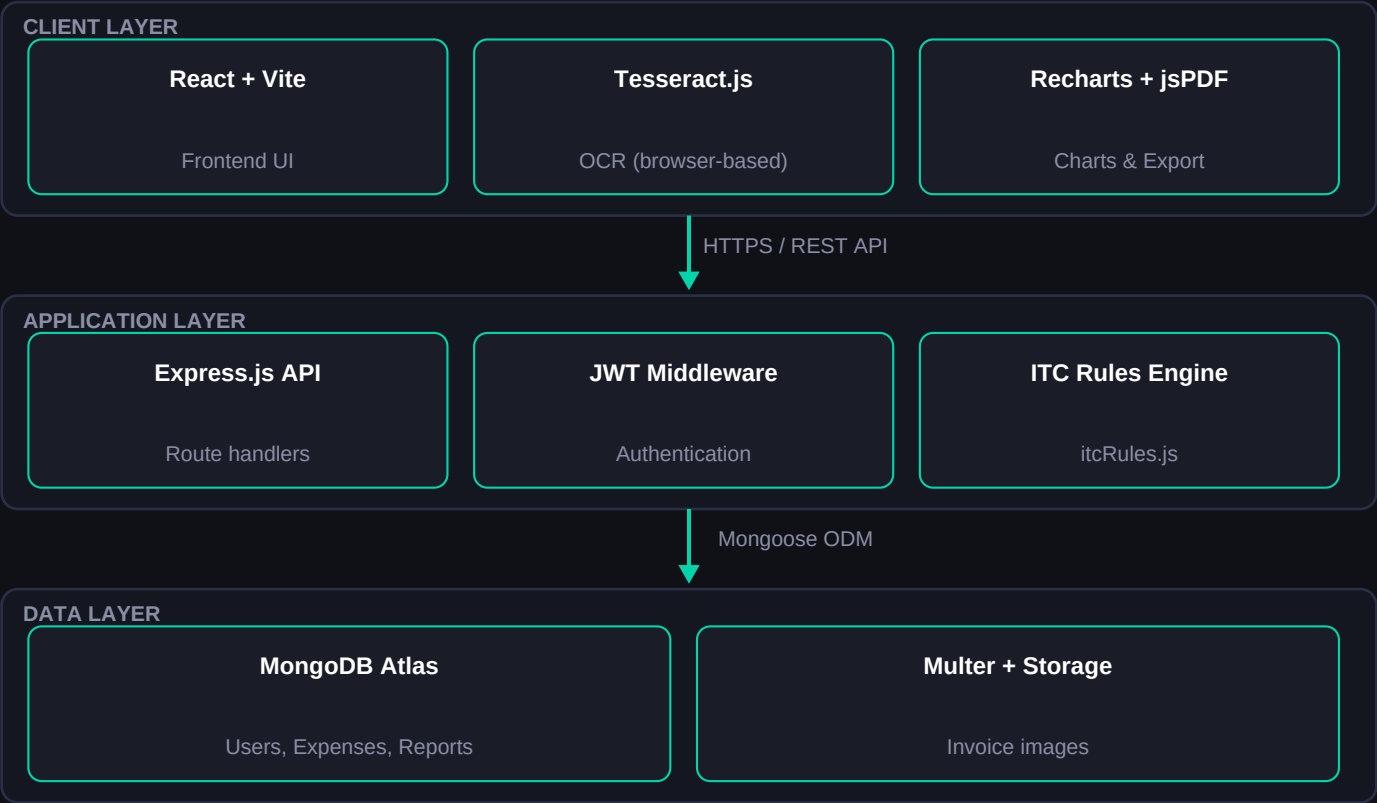

ITC Classification Logic

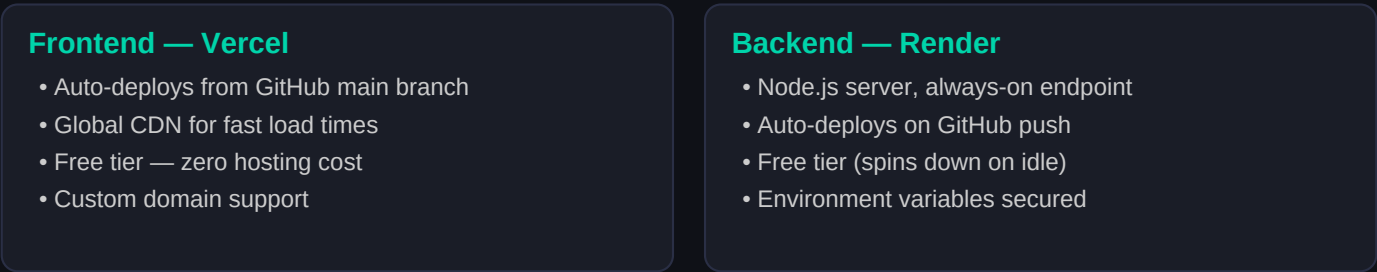

Category	Examples	ITC Status
Internet & Cloud	Airtel, AWS, Vercel, GitHub	■ Claimable
Hardware	Laptop, Monitor, Mouse, Keyboard	■ Claimable
Software / SaaS	Adobe, Figma, Notion, Zoom	■ Claimable
Food & Beverages	Swiggy, Zomato, Restaurants	■ Not Claimable
Cab Rides	Uber, Ola, Rapido	■ Not Claimable
Phone Bill	Airtel, Jio Postpaid	■■ Needs Review
Home Electricity	Any provider	■■ Needs Review

Architecture & High-Level Design

System Overview

Deployment Architecture

Data Models

MongoDB Schema Design

User Schema

```
{
  name: String // required
  email: String // unique
  password: String // bcrypt hashed
  gstin: String // optional
  businessName: String
  createdAt: Date // auto
}
```

Expense Schema

```
{
  userId: ObjectId // → User ref
  vendorName: String
  amount: Number // excl. GST
  gstPaid: Number
  category: Enum // internet|software|hardware...
  itcStatus: Enum // claimable|not_claimable|review
  itcReason: String // plain-English explanation
  confidence: Enum // high|medium|low
  invoiceUrl: String // file path
  invoiceDate: Date
  filingMonth: String // YYYY-MM format
  createdAt: Date // auto
}
```

Key Design Decisions

- **Filing month as string**

Stored as "YYYY-MM" for fast grouping, deadline calculation, and human-readable queries — avoids complex date range operations.

- **ITC status computed at write time**

Classification runs once when the expense is saved, not on every dashboard query. This keeps the dashboard instant.

- **Confidence score stored**

Stored alongside the ITC status so users know when a result is certain vs. when they should double-check with a CA.

Impact

Who This Is Built For

The Freelancer

Bills ₹80,000/month to corporate clients. Registered for GST but never claims ITC. ITClaim saves them ~₹3,200/month — ₹38,400 per year.

UI/UX Designer

The Consultant

Runs a one-person firm. Buys cloud, software, and coworking subscriptions. Leaves ~₹40,000/year unclaimed without ITClaim.

Independent Tech Consultant

The Micro-Agency

Multiple team expenses, no CA on retainer. ITClaim replaces a ₹5,000/month accountant for basic ITC tracking and filing prep.

3-Person Design Studio

"If just 1% of India's 6.3 crore GST registered businesses used ITClaim and each saved ₹20,000/year — that's ₹12,600 crore returned to small businesses annually."

Built By

ITClaim was designed and built by Rishabh Hirwe, a final year Computer Science & Engineering student. This project is a genuine attempt to solve a real problem faced by millions of Indian freelancers and small businesses. It is live and fully functional at it-claim.vercel.app — free to use, with no CA required. Rishabh is actively looking for opportunities and would love to bring this same energy to Presolv360.

ITClaim — because the government shouldn't profit from complexity.
